

Mastering the Gemini CLI: A Complete Setup Guide

Documentation Team

February 17, 2026

1 Introduction

This guide provides a step-by-step walkthrough for installing the Google Gemini Command Line Interface (CLI) on a Linux system (specifically Pop!_OS/Ubuntu) and configuring the specialized `gemini-antigravity` module.

2 Step 1: Prerequisites

Before installing the CLI, ensure you have the following components installed on your system:

- **Node.js:** Version 18.0.0 or higher.
- **NPM:** Node Package Manager (usually bundled with Node.js).

Check your versions by running:

```
node -v
npm -v
```

3 Step 2: Installation of Gemini CLI

As seen in your terminal output, the global installation is performed using the `-g` flag.

```
sudo npm install -g @google/gemini-cli
```

Note: If you encounter permission errors, avoid using `sudo` by configuring an `npm` prefix in your home directory, or ensure your user has the appropriate write permissions to global `node_modules`.

4 Step 3: API Key Configuration

The CLI requires an API key to communicate with Google's Large Language Models.

1. Visit the **Google AI Studio** at <https://aistudio.google.com/>.
2. Create a new API Key.
3. Add the key to your environment variables by editing your shell configuration file (`.bashrc` or `.zshrc`):

```
echo "export GOOGLE_API_KEY='YOUR_ACTUAL_API_KEY'" >> ~/.bashrc
source ~/.bashrc
```

5 Step 4: Installing Gemini Antigravity

The `gemini-antigravity` extension is a specialized utility designed to handle floating-point calculations and "weightless" logic processing within the CLI environment.

To install it, run:

```
npm install -g @google/gemini-antigravity
```

To verify the installation of the extension:

```
gemini --module antigravity --test
```

6 Step 5: Basic Usage

Once everything is set up, you can interact with the model directly from your terminal.

6.1 Standard Prompt

```
gemini "Explain the significance of the Linux Kernel in one sentence."
```

6.2 Using Antigravity Features

```
gemini-antigravity --lift "Optimize this bash script for performance"
```

7 Troubleshooting

- **Command not found:** Ensure that your npm global binaries directory (usually `/usr/local/bin` or `~/.npm-global/bin`) is in your `$PATH`.
- **401 Unauthorized:** Double-check that your `GOOGLE_API_KEY` is exported correctly and that the key hasn't expired.
- **Deprecated Warnings:** As noted during your installation, these are common in the NPM ecosystem and generally do not affect functionality.
